

This is a Continuation Application of USSN10/129,503 filed May 6, 2002

Title

Core for Pagewidth Printhead

Field of the Invention

5 The present invention relates to printers, and in particular to digital inkjet printers.

Co-Pending Applications

Various methods, systems and apparatus relating to the present invention are disclosed in the following co-pending applications filed by the applicant or assignee of the present invention on 24 May 2000:

10	PCT/AU00/00578	PCT/AU00/00579	PCT/AU00/00581	PCT/AU00/00580
	PCT/AU00/00582	PCT/AU00/00587	PCT/AU00/00588	PCT/AU00/00589
	PCT/AU00/00583	PCT/AU00/00593	PCT/AU00/00590	PCT/AU00/00591
	PCT/AU00/00592	PCT/AU00/00584	PCT/AU00/00585	PCT/AU00/00586
	PCT/AU00/00594	PCT/AU00/00595	PCT/AU00/00596	PCT/AU00/00597
15	PCT/AU00/00598	PCT/AU00/00516	PCT/AU00/00517	PCT/AU00/00511

Various methods, systems and apparatus relating to the present invention are disclosed in the following co-pending application, PCT/AU00/01445 filed by the applicant or assignee of the present invention on 27 November 2000. The disclosures of these co-

20 pending applications are incorporated herein by cross-reference. Also incorporated by cross-reference, is the disclosure of a co-filed PCT application, PCT/AU01/00238 (deriving priority from Australian Provisional Patent Application No. PQ6059).

Background of the Invention

Recently, inkjet printers have been developed which use printheads manufactured by

25 micro-electro mechanical system(s) (MEMS) techniques. Such printheads have arrays of microscopic ink ejector nozzles formed in a silicon chip using MEMS manufacturing techniques.

Printheads of this type are well suited for use in pagewidth printers. Pagewidth printers have stationary printheads that extend the width of the page to increase printing speeds. Pagewidth printheads do not traverse back and forth across the page like
5 conventional inkjet printheads, which allows the paper to be fed past the printhead more quickly.

To reduce production and operating costs, the printheads are made up of separate printhead modules mounted adjacent each other on a support beam in the printer. To ensure that there are no gaps or overlaps in the printing produced by adjacent printhead modules it
10 is necessary to accurately align the modules after they have been mounted to the support beam. Once aligned, the printing from each module precisely abuts the printing from adjacent modules.

Unfortunately, the alignment of the printhead modules at ambient temperature will change when the support beam expands as it heats up during printhead operation.
15 Furthermore, if the printhead modules are accurately aligned when the support beam is at the equilibrium operating temperature, there may be unacceptable misalignments in any printing before the beam has reached the operating temperature. Even if the printhead is not modularized, thereby making the alignment problem irrelevant, the support beam and printhead may bow because of different thermal expansion characteristics. Bowing across
20 the lateral dimension of the support beam does little to affect the operation of the printhead. However, as the length of the beam is its major dimension, longitudinal bowing is more significant and can affect print quality.

Summary of the Invention

Accordingly, the present invention provides a printhead assembly for a digital inkjet printer, the printhead assembly including:

- a support member for attachment to the printer;
- 5 a printhead adapted for mounting to the support member;
- the support member having an outer shell and a core element defining at least one ink reservoir such that the effective coefficient of thermal expansion of the support member is substantially equal to the coefficient of thermal expansion of the printhead.

Preferably, the outer shell is formed from at least two different metals laminated
10 together and the printhead includes a silicon MEMS chip. In a further preferred form, the support member is a beam and the core element is a plastic extrusion defining four separate ink reservoirs. In a particularly preferred form, the metallic outer shell has an odd number of longitudinally extending layers of at least two different metals, wherein layers of the same metal are symmetrically disposed about the central layer.

15 It will be appreciated that by laminating layers of uniform thickness of the same material on opposite sides of the central layer, and at equal distances therefrom, there is no tendency for the shell to bow because of a dominating effect from any of the layers.

However, if desired, bowing can also be eliminated by careful design of the shells cross section and variation of the individual layer thicknesses.

20 In some embodiments, the printhead is a plurality of printhead modules positioned end to end along the beam.

Brief Description of the Drawing.

A preferred embodiment of the invention will now be described, by way of example only, with reference to the accompanying drawing in which:

Figure 1 is a schematic cross section of a printhead assembly according to the present invention.

Detailed Description of the Preferred Embodiments.

Referring to the figure, the printhead assembly 1 includes a printhead 2 mounted to
5 a support member 3. The support member 3 has an outer shell 4 and a core element 5
defining four separate ink reservoirs 6, 7, 8 and 9. The outer shell 4 is a hot rolled trilayer
laminate of two different metals. The first metal layer 10 is sandwiched between layers of
the second metal 11. The metals forming the trilayer shell are selected such that the
effective coefficient of thermal expansion of the shell as a whole is substantially equal to
10 that of silicon even though the coefficients of the core and the individual metals may
significantly differ from that of silicon. Provided that the core or one of the metals has a
coefficient of thermal expansion greater than that of silicon, and another has a coefficient
less than that of silicon, the effective coefficient can be made to match that of silicon by
using different layer thicknesses in the laminate.

15 Typically, the outer layers 11 are made of invar which has a coefficient of thermal
expansion of $1.3 \times 10^{-6} \text{ m}^{\circ}\text{C}$. The coefficient of thermal expansion of silicon is about $2.5 \times$
 $10^{-6} \text{ m}^{\circ}\text{C}$ and therefore the central layer must have a coefficient greater than this to give the
support beam an overall effective coefficient substantially the same as silicon.

The printhead 2 includes a micro moulding 12 that is bonded to the core element 5.
20 A silicon printhead chip 13 constructed using MEMS techniques provides the ink nozzles,
chambers and actuators.

As the effective coefficient of thermal expansion of the support beam is
substantially equal to that of the silicon printhead chip, the distortions in the printhead
assembly will be minimized as it heats up to operational temperature. Accordingly, if the

assembly includes a plurality of aligned printhead modules, the alignment between modules will not change significantly. Furthermore, as the laminated structure of the outer shell is symmetrical in the sense that different metals are symmetrically disposed around a central layer, there is no tendency of the shell to bow because of greater expansion or contraction of any one metal in the laminar structure. Of course, a non-symmetrical laminar structure could also be prevented from bowing by careful design of the lateral cross section of the shell.

The invention has been described herein by way of example only. Skilled workers in this field will readily recognise that the invention may be embodied in many other forms.
